Edge anchoring stabilizes perovskite quantum dots via multi-amino ligands

Qingsen Zeng

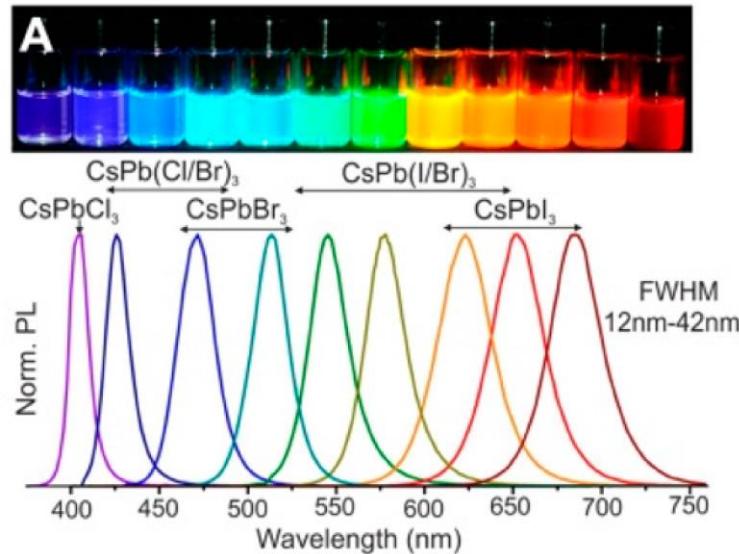

Email: zengq@jlu.edu.cn

Jilin University, China

Perovskite quantum dots (PQDs)

Advantages

- high PL QY
- narrow emission
- low defect density
- tunable emissive peaks
- easy-to-prepare

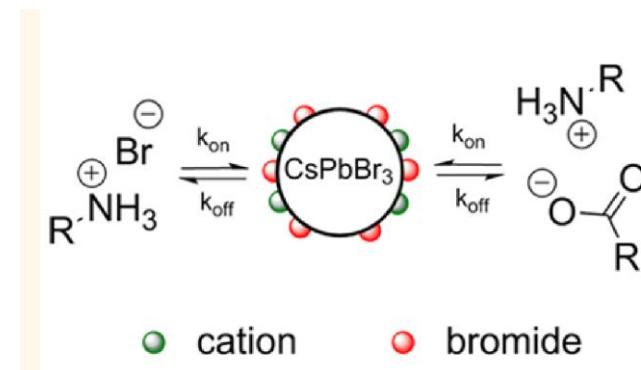

➤ Kovalenko* et al. *Nano Lett.* **2015**, *15*, 3692

Challenge: stability

Origin:

- ionic crystal
- loose binding ligand

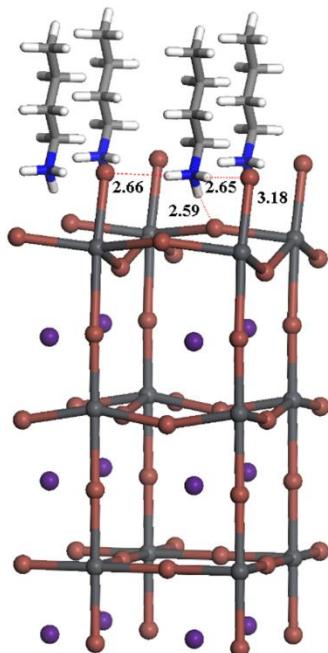

➤ Kovalenko*, Hens* et al. *ACS Nano* **2016**, *10*, 2071

Edge anchoring via multi-amino ligands

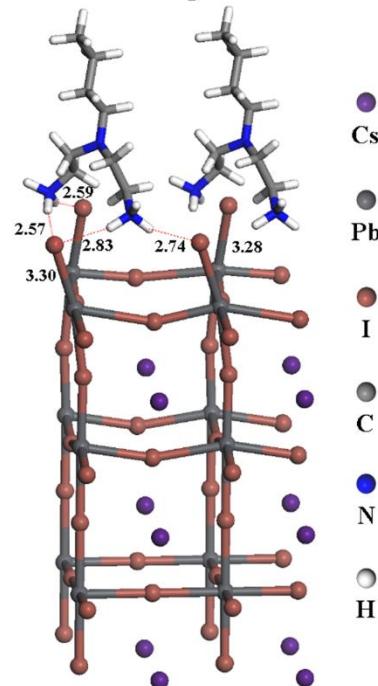

a

Single-amino OLA

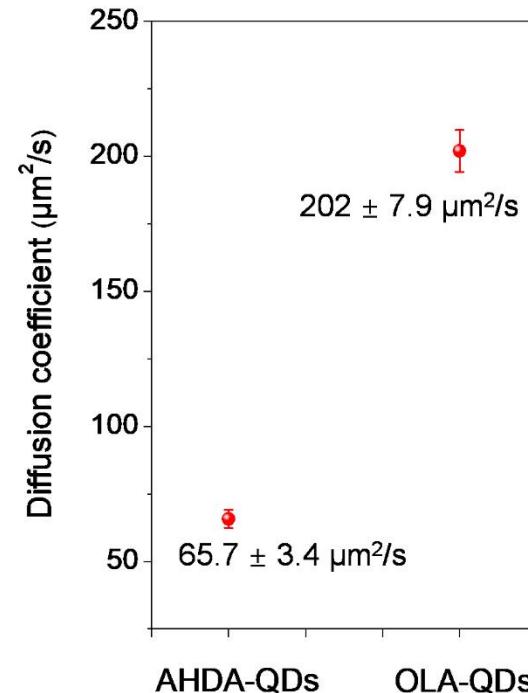

b

Chelating AHDA

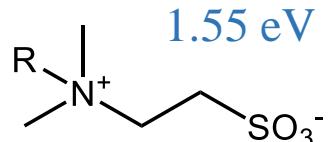

c

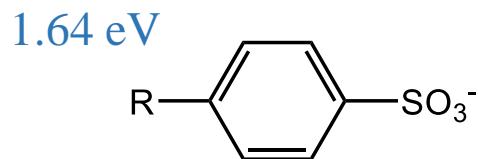

Binding energy: 1.47 eV

2.36 eV

Haibo Zeng* Adv. Mater. 2019, 1900767

AHDA-CsPbI₃ PQDs

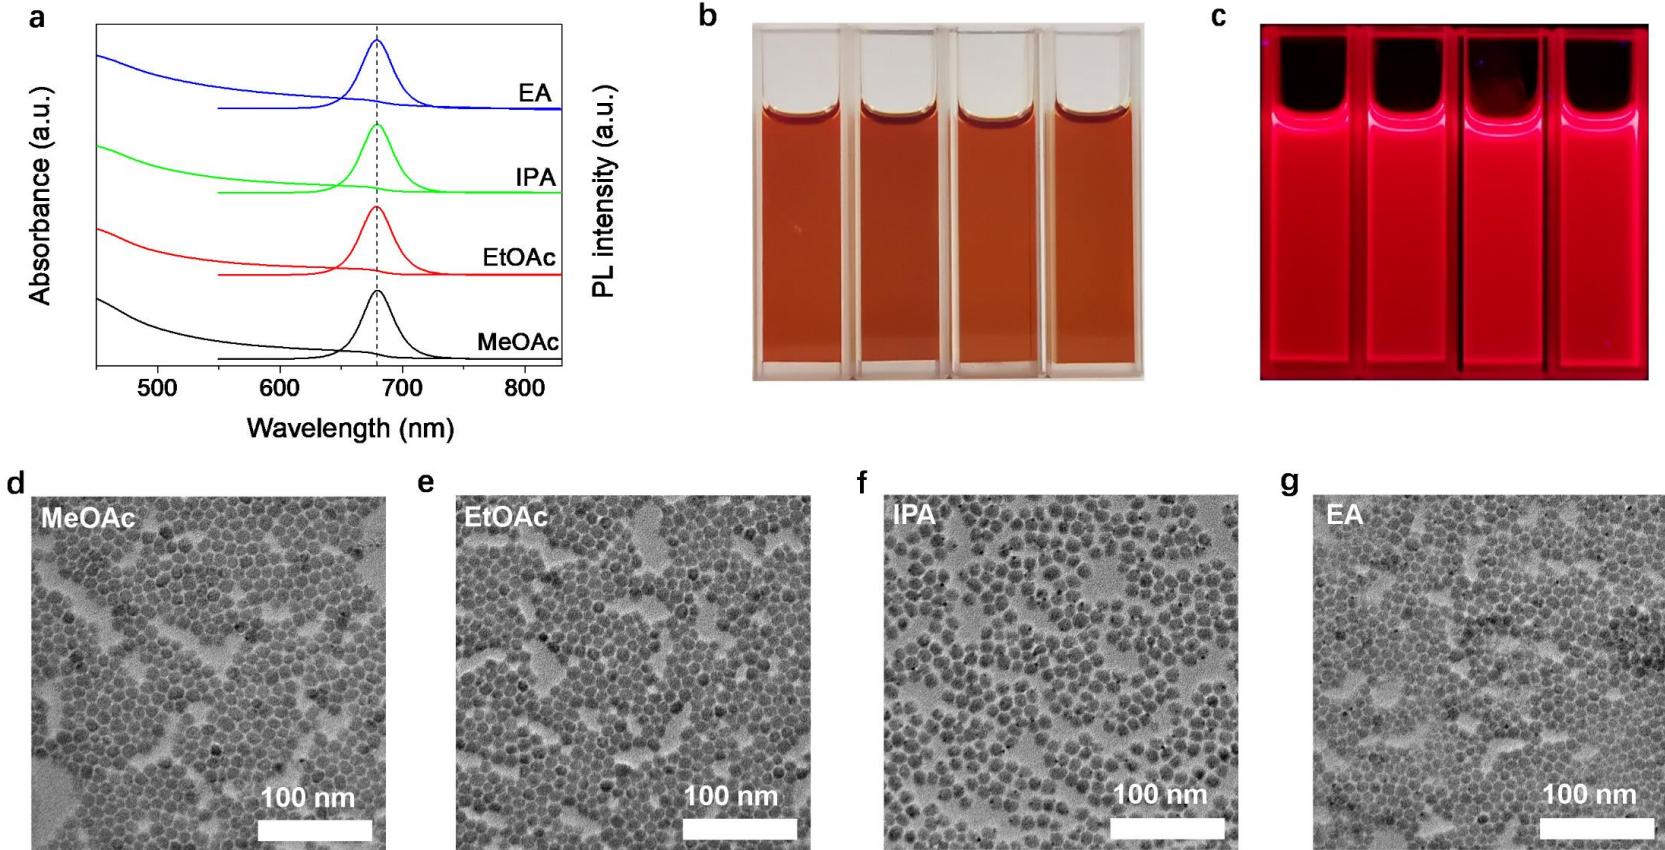

Optical properties and morphology can be maintained over **15** purification cycles

OLA-CsPbI₃ PQDs

Spectra and structures changed with purification cycles

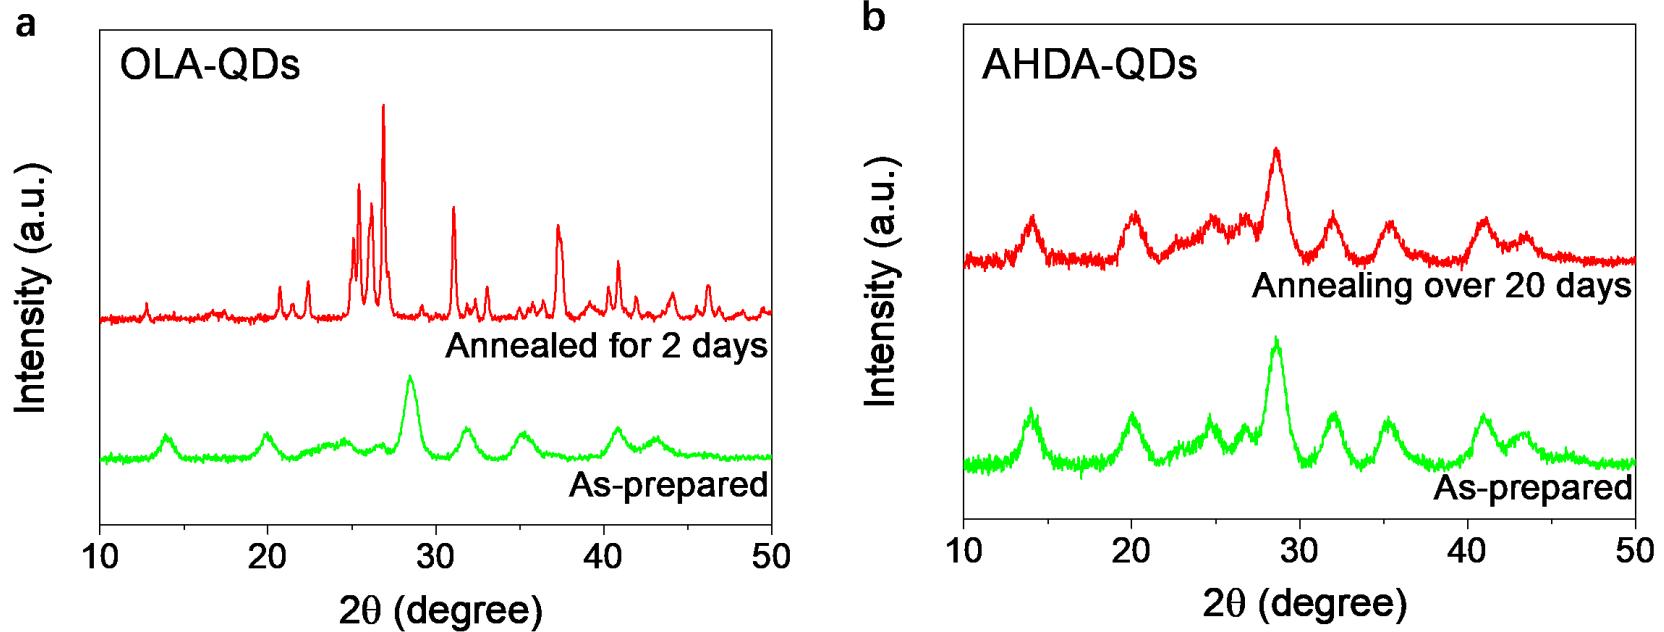

AHDA-CsPbI₃ PQDs in polar solvent

Optical properties and morphology can be maintained even in ethanol (EA)

Phase stability

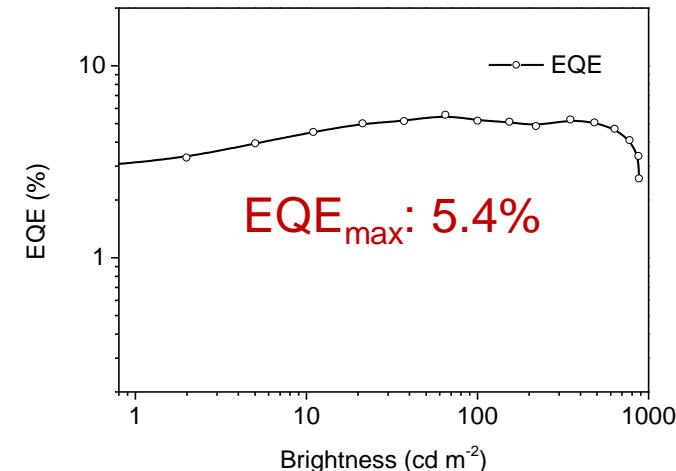

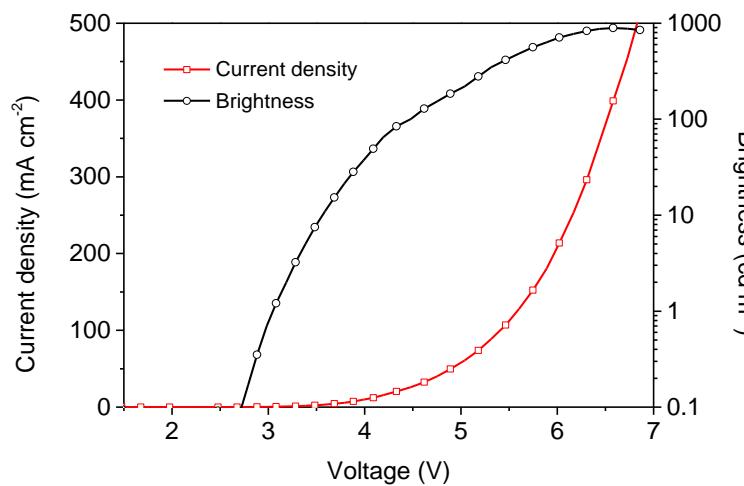

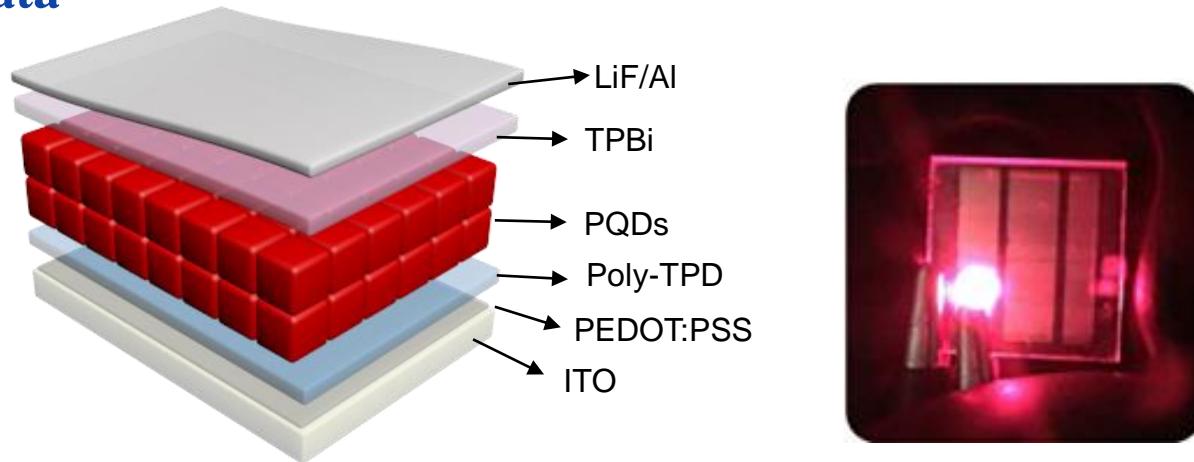

Annealed at 85°C in air with relative humidity of 30-40%

Phase stability of AHDA-stabilized CsPbI_3 PQDs maintained for > 20 days

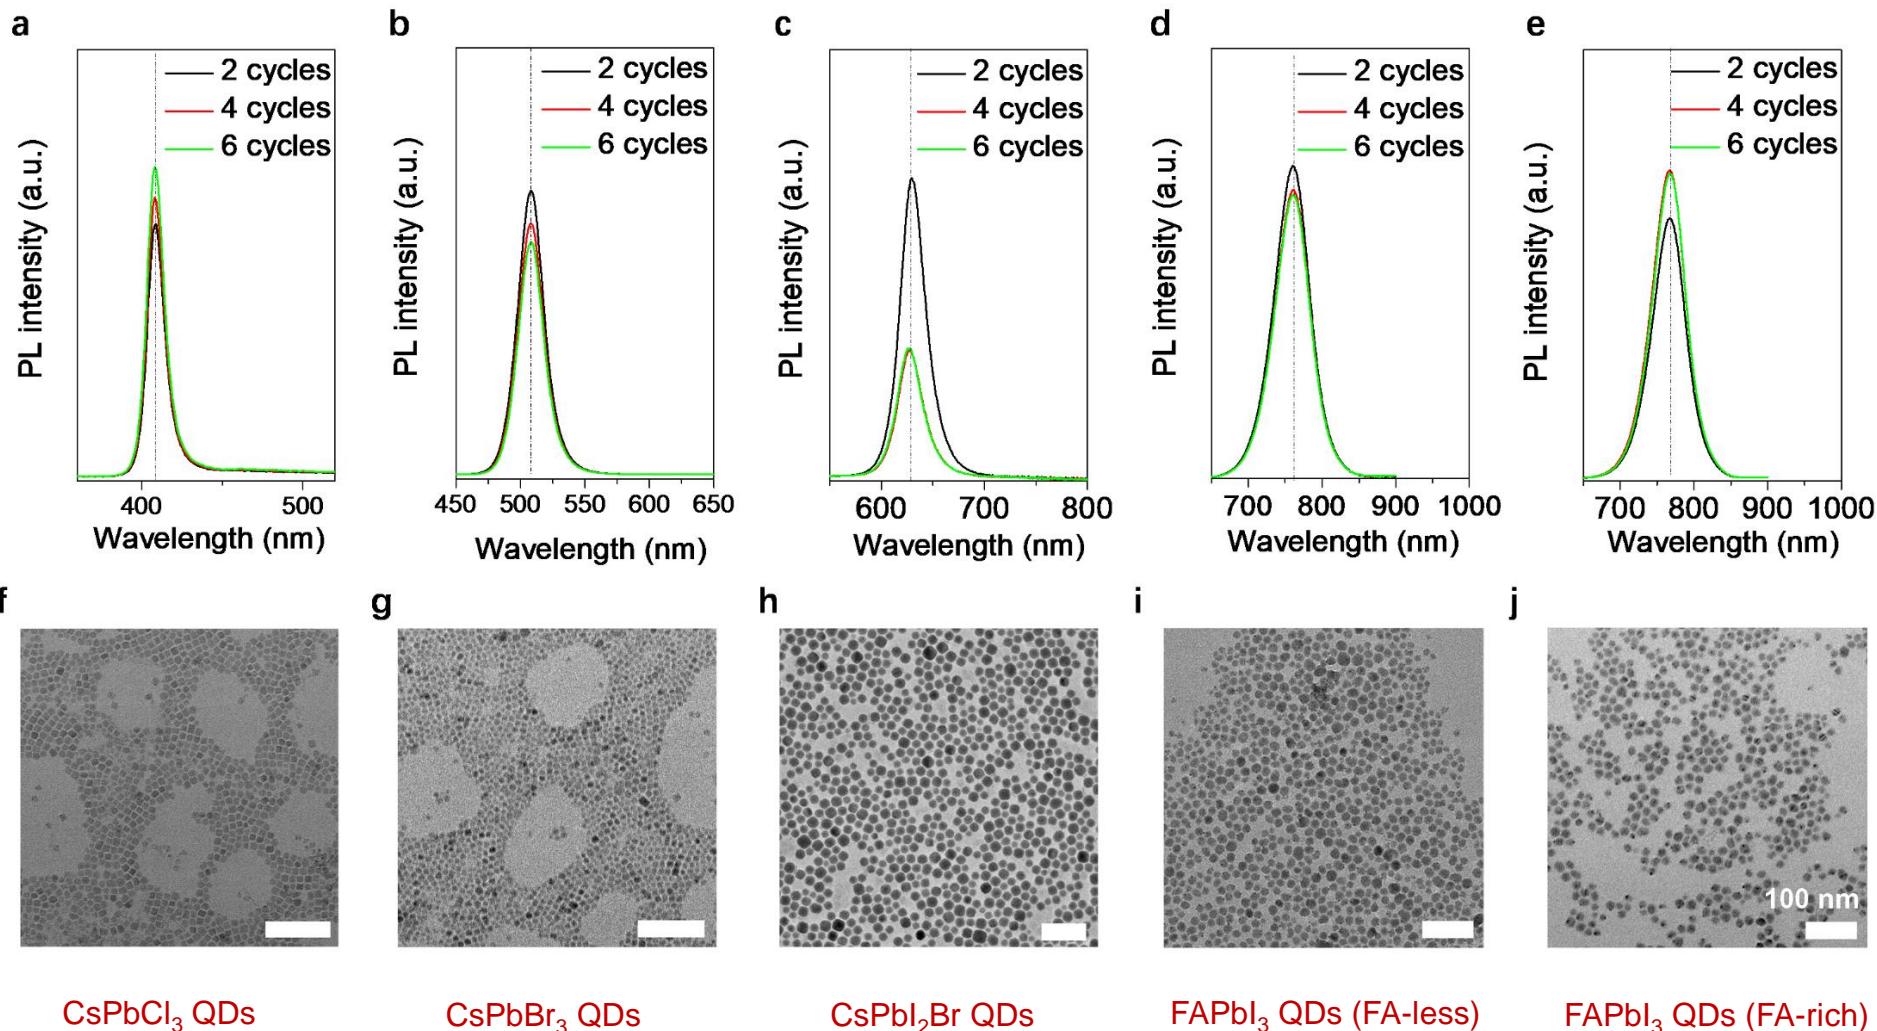

LEDs devices

Preliminary data

The performance is optimizing, and device stability and **ionic migration** are under evaluation

Universality of AHDA

Summary

- We developed a robust multi-amino ligand named AHDA, which allows to attach AHDA on PQD surface with high binding energy reaching 2.36 eV.
- AHDA can stabilize PQDs against purification, heat and polar solvent.
